

$$c^T x \geq L(x, \lambda) \geq \underbrace{\inf L(x, \lambda)}_{\text{下界}} \quad \text{图: } \inf L(x, \lambda) = 0$$

$\inf L(x, \lambda)$: 拉格朗日对偶函数.

goal: $\max \inf L(x, \lambda)$

(即使原始问题非凸, 其对偶始终为凸) 对.

对偶性质:

① weak duality

$p^* \Rightarrow$ prime problem

$d^* \Rightarrow$ dual problem

$$\Rightarrow d^* \leq p^*$$

$$g(\lambda, v) = \inf L(x, \lambda, v) \leq L(x, \lambda, v) \leq f(x)$$

② Strong duality

$$\text{if } d^* = p^*$$

一般不存在

如果原问题是凸的, 则通常存在.

① check 计算

② 卜: 增加 Outline

互补松弛性:

$$y^T b = y^T A x$$

$$C^T x = y^T A x$$

$$\Rightarrow y^T b = C^T x$$

原问题目标函数与对偶问题目标函数相同.

KKT for LP:

① 原问题可行

② 对偶问题可行

$$\textcircled{3} L(x, y) = C^T x - y^T (Ax - b)$$

④ 互补松弛性. ($C^T x = y^T b$)

$$\text{Primer: } \min \quad Ax \leq b \\ \text{s.t. } x \geq 0$$

$$\text{Dual: } \max \quad y^T b \\ \text{s.t. } y \leq 0 \\ y^T A \leq C$$

找 x, y 同时满足:

① 原问题可行

② 对偶问题可行

$$\textcircled{3} C^T x = y^T b$$

$$\textcircled{1} + \textcircled{3} \Rightarrow \textcircled{2}$$

$$\textcircled{2} + \textcircled{3} \Rightarrow \textcircled{1}$$

$$\textcircled{1} + \textcircled{2} \Rightarrow \textcircled{3}$$
